The invention relates to novel nucleic acid sequences derived from rat clearmal papilla, human keratinocytes and meonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhabit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle to treat growth and developmental defects, skin wounds and hair follicle CC disorders. Sequences AA261606-261832 represent cDNA sequences derived CC AA261606-261649, AA261725-261765, AA261802-261811 and AA261826 encode CC CAA261832 represent cDNA sequences derived CC CAA2618381 and AA261826 encode CC CAA261839 encode proteins with an N-terminal signal sequence, indicating that the proteins CC are secreted. Sequences AA261650-261668, AA261766-261780, AA261812-261817 and AA261827-261829 encode proteins with one or more putative transmembrane domains.

The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of
